

Chemical Cost-per-Use Worksheet

Compare concentrate economics using usable solution and dose per task - not only the purchase price of the pack.

PRODUCT _____	PACK SIZE _____	PACK COST _____	PREPARED BY _____
------------------	--------------------	--------------------	----------------------

Core calculation

Usable solution. Calculate from the product's approved dilution. **Cost per usable litre.** Pack cost ÷ total usable litres. **Cost per task.** Cost per usable litre × litres used per task.

Scenario worksheet

SCENARIO	DILUTION / DOSE	USABLE LITRES	COST / USABLE L	LITRES / TASK	COST / TASK
Routine use					
Heavy soil					
Alternate product					

Decision notes

Assumptions _____ _____ _____	Commercial implication _____ _____ _____
--	---

Control note. Use the product's actual dilution convention. Cost per task = cost per usable litre x litres used per task, plus labour / equipment costs if you are comparing total process cost.
